

PowerPlan Manager

PowerPlan Manager is a simple tray app that changes the Windows Power Plan from the system's current, to a special 'Power Saving' plan automatically after a short period of inactivity (~3min). The special thing about this Power Plan is that it uses 50% speed of the CPU, thus saving energy, cooling the system down, making it more efficient without compromising system response and latency, because when the user touches the mouse, presses a key on the keyboard or any other input device, the system returns to the default Power Plan immediately.

The app runs automatically with Windows and senses upon start-up the chosen Power-Plan by the user. If you want to change the default Power Plan you must first exit the app, change the plan and then reboot. Now the app will pick the new Power Plan as default. If you want to disable auto-run, toggle it at Task Manager/Startup apps.
